

This paper explicates the regenerative braking technique in electric vehicles (EV"s), hybrid electric vehicles (HEV"s), and plug-in hybrid electric vehicles (PHEV"

Energy saving can be easily determined by evaluating the energy recovered inside the storage system, during regenerative braking of the train entering in the railway node.

This review presents recent progress in bidirectional converters and regenerative braking systems (RBSs), highlighting their contributions to energy recovery, ...

Regenerative braking systems (RBS) enhance energy efficiency and range in electric vehicles (EVs) by recovering kinetic energy during braking for storage in batteries or ...

Abstract Braking energy recovery (BER) notably extends the range of electric vehicles (EVs), yet the high power it generates can diminish battery life. This paper proposes ...

The system converts the kinetic energy generated during deceleration into electrical energy that can be stored in the battery for future use, thus maximizing energy ...

How It Differs from Conventional Braking Systems Unlike traditional braking systems that operate solely through friction, regenerative braking introduces a unique process. ...

This study investigates the efficiency and safety of regenerative brake energy recuperation systems for electric vehicles. A three-input single-output fuzzy controller is ...

Regenerative braking technology is a viable solution for mitigating the energy consumption of electric vehicles. Constructing a distribution strategy for regenerative braking ...

Regeneration happens only when brakes are applied and the amount of energy derived depends on the running speed of the vehicle. It is a simple process that involves ultra-capacitors, for ...

Then, the research on the variation law of the brake regenerative energy of pure electric vehicles affected by the normal and low temperature environment and the different ...

In the regenerative braking mode of metro trains, the energy-storage system and energy-feedback system absorb a portion of the regenerative braking energy. This reduces the ...

In contrast, brake energy storage systems employ regenerative braking, allowing the kinetic energy generated

during deceleration to be captured and converted into electrical ...

This is used to boost braking torque to stop the rotating motor in an efficient way while braking. Experiments are conducted to verify the proposed design. Compared to the traditional kinetic ...

This paper proposes an optimization strategy for BER that employs a hybrid energy storage system (HESS), integrating a flywheel energy storage system (FESS) with a ...
