

How long should a concrete pool be empty?

You should leave your concrete pool empty for as little time as possible. Swimming pools are meant to be filled with water. If that's taken away, the pool can be damaged. Although concrete pools are safer to empty than other types like fiberglass or vinyl-lined pools, they should not be left empty for more than a few days.

Can a concrete pool be left empty?

No swimming pool, including a concrete pool, should be left empty for prolonged periods of time. Compared to other types of pools, concrete pools can be left empty for a bit longer. They are constructed to be the most durable, yet you still shouldn't leave your concrete pool empty for long periods of time.

Should a concrete pool be left empty during winter?

Some people assume that a concrete pool needs to be left empty over the winter months, but that's not the case. You just need to take appropriate steps to winterize your pool. You will lower the water level slightly, but you don't need to remove all of the water in its entirety. What Happens if a Swimming Pool is Left Empty?

Should you drain a concrete pool in winter?

Concrete pools are designed for year-round use, so it's probably not a good idea if yours is empty during winter. In fact, draining your pool doesn't mean you can leave it empty all winter long. It just means there isn't any water and therefore no internal pressure. And that's not always a good thing.

Will a concrete pool crack if you empty it in winter?

The concrete pool walls are very thick, but they are still subject to cracking if something happens to them. If you empty your concrete pool during winter, there's a chance it will crack because of the weight of the groundwater pressure build-up below. However, leaving the water in the pool will not have any weight and will be fine.

What happens if a concrete pool is drained?

However strong concrete pools may be, damages can still arise when they are drained. Some pools might pop out of the ground while others can cave in. That's because pools get used to the heavy weight and pressure of the water. When it's removed, groundwater and surrounding soil pressure can cause the pool's various components to become disfigured.
