

Can the e-chu solid-state drive be overclocked

Is SSD overclocking possible?

SSD Overclocking - Not only possible, but doable at home! In today's article, we will do something unprecedented that I believe has not been done before. Many years ago, Intel had released an SSD capable of overclocking but only as a demonstration and today, we will use a 2.5" SATA SSD that I acquired for this overclocking project.

Can a SATA SSD overclock?

Many years ago, Intel had released an SSD capable of overclocking but only as a demonstration and today, we will use a 2.5" SATA SSD that I acquired for this overclocking project. But before that, let's take a look at the specifications of this SSD.

What SSD does the overclocker use?

The overclocker uses an unknown drive called RZX Pro 240GB DRAM-Less SATA-based SSD for this adventure. He didn't choose an NVMe SSD since these drives already run at their best potential, showing little to no visible performance yield for this experiment. The other reason why he chose this is because of the internal components used in this SSD.

Do I need extra cooling for my NVMe SSD?

If the airflow in the computer is good, you don't need extra cooling for your SSD. However, if you notice that your NVMe SSD often runs above its intended operating temperature, then it might be a good idea. For most M.2 SSDs, the recommended operating temperature is between 32°F (0°C) and 158°F (70°C).

What is the difference between overclocked SSD & stock SSD?

Regarding temperature and power draw, he shows the SSD always operates at 40 degrees Celsius under stock settings while the overclocked drive operates at 45 degrees Celsius. The manufacturer programmed the drive to work up to 40 degrees Celsius, making the drive clock itself down when needed to maintain this limit.

How does Gabriel overclock a SSD?

Gabriel acquired a SATA III to USB 3.0 adapter with a JMS578 bridge chip to perform the overclock. This adapter allows hot swapping of SSDs without the need to turn off the PC. He shorted two terminals in the drive's PCB to get the SSD to operate without its default safe mode.

The first Flash-based drives began to emerge as options for notebooks in 2007. Vendors such as Apple and Dell offer SSDs on selected notebooks at anywhere from \$900 to ...
