

How to determine the operation strategy of a pumped storage power station?

When formulating the operation strategy of the power station, reference can be made to the operation data reported by the power station for the five years from 2018 to 2022. The power consumption and power generation of the pumped storage power station during this period are shown in Figure 5.

How can pumped storage power stations be fully independent?

In the model of "completely independent participation in the market", the technical transformation of the pumped storage power station should be accelerated, the energy conversion efficiency of the power station should be reasonably improved, the power loss should be reduced, and the cost recovery of the power station should be promoted.

Is energy storage a profitable business model?

Although academic analysis finds that business models for energy storage are largely unprofitable, annual deployment of storage capacity is globally on the rise (IEA, 2020). One reason may be generous subsidy support and non-financial drivers like a first-mover advantage (Wood Mackenzie, 2019).

How do business models of energy storage work?

Building upon both strands of work, we propose to characterize business models of energy storage as the combination of an application of storage with the revenue stream earned from the operation and the market role of the investor.

How much electricity does a pumped storage power station generate?

Within 5 years, the pumped storage power station will pump 2.09 billion kWh of electricity annually and generate 1.682 billion kWh of electricity annually. Figure 5. Power consumption/power generation of the pumped storage power station during 2018-2022 (billion kWh). The typical daily operation strategy of the power station is shown in Figure 6.
