

Do fluorite-structured antiferroelectric oxides have energy storage properties?

This work reviews the energy storage properties of fluorite-structured antiferroelectric oxides (HfO_2 and ZrO_2), along with 3-D device structures, the effect of negative capacitance on the energy storage characteristics of fluorites, and the future prospects of this research field.

Why is fluorite amorphous?

The amorphous structure is owing to oxygen instability between the two energetically-favorable crystalline forms, in which not only the long-range periodicities of fluorite and perovskite are collapsed but also more than one symmetry, i.e., the monoclinic and orthorhombic, coexist in short range, giving rise to a strong structure disordering.

What is the energy density of fluorite HfO_2 and perovskite hafnate?

Here, by structure evolution between fluorite HfO_2 and perovskite hafnate, we create an amorphous hafnium-based oxide that exhibits the energy density of $\sim 155 \text{ J/cm}^3$ with an efficiency of 87%, which is state-of-the-art in emergingly capacitive energy-storage materials.

Does fluorite HfO_2 have a breakdown strength 12 mV/cm ?

Here, by employing a new structure-evolution strategy between fluorite HfO_2 and perovskite hafnate (A HfO_3 , where A is a divalent ion), we create an amorphous hafnium-based oxide that exhibits a breakdown strength as high as $\sim 12 \text{ MV/cm}$.

Why are liquid fluoride-ion electrolytes used in batteries?

The motivation behind developing liquid fluoride-ion electrolytes for batteries is to achieve better ionic conductivity in the electrolyte and a wider ESW. Although alkali metal fluorides are readily available, their solubility in commonly used high-boiling organic solvents is usually less than 0.05 M .

How does fluoride affect conductivity?

For instance, the addition of small amounts of metal fluoride leads to a significant increase in conductivity [,,,]. In the case of the homogeneous compound $\text{Ba}_{1-x}\text{La}_x\text{F}_{2+x}$, formed by doping rare-earth fluoride-doped BaF_2 , the conductivity increases sharply with increasing x for small amounts of dopant.
