Is automated disassembly possible at the end-of-life stage?

The feasibility of automated disassembly at a product's end-of-life stage strongly depends on its design. This relationship is particularly relevant for electric vehicle batteries, for which other design requirements are typically given priority.

How can a disassembly-oriented design process be integrated into existing product development procedures?

As mentioned in Section 1, the aim is to seamlessly integrate the results of this publication into existing product development procedures. A suitable starting point for the disassembly-oriented design development is to combine the components with the best evaluation results of into a new product, similar to the procedure of a morphological box.

What is the conceptual framework for automated cell disassembly?

Conceptual framework for automated cell disassembly. At the cell level, the disassembly process is initiated with a comprehensive cell condition check, encompassing aspects such as residual voltage, physical appearance including deformation and mechanical damage.

Are disassembly-oriented design requirements more important than product development requirements?

In current product development, these requirements are often given priority over the requirements of a disassembly-oriented design, which results in a high effort during disassembly and prevents its automation. In the framework of this publication detailed disassembly experiments of five market available battery designs have been conducted.

How to develop a design for automated disassembly guidelines?

Derivation of design for automated disassembly guidelines As mentioned in Section 1, the aim is to seamlessly integrate the results of this publication into existing product development procedures. A suitable starting point for the disassembly-oriented design development is to combine the components with the best evaluation results of

What is automated disassembly framework?

Automated disassembly framework Following the manual dismantling of the investigated battery cells, the internal structures and joints are clearly determined. The identification of component joints within the cell facilitates the development of methods for cell disassembly and components separation.
