

Functional architecture design of outdoor energy storage power supply

What is a flexible energy storage power station (fesps)?

Firstly, this paper proposes the concept of a flexible energy storage power station (FESPS) on the basis of an energy-sharing concept, which offers the dual functions of power flow regulation and energy storage. Moreover, the real-time application scenarios, operation, and implementation process for the FESPS have been analyzed herein.

How energy storage and non-fault side power grid regulated power flow?

In this mode, the power flow can be regulated by the energy storage or non-fault side power grid through the FESPS to ensure uninterrupted power supply. In addition, the energy storage and non-fault side power grid could jointly realize uninterrupted power supply for the load.

How can energy storage system reduce the cost of a transformer?

Concurrently, the energy storage system can be discharged at the peak of power consumption, thereby reducing the demand for peak power supply from the power grid, which in turn reduces the required capacity of the distribution transformer; thus, the investment cost for the transformer is minimized.

What is a mobile energy storage system?

A mobile energy storage system is composed of a mobile vehicle, battery system and power conversion system. Relying on its spatial-temporal flexibility, it can be moved to different charging stations to exchange energy with the power system.

How do different resource types affect mobile energy storage systems?

When different resource types are applied, the routing and scheduling of mobile energy storage systems change. (2) The scheduling strategies of various flexible resources and repair teams can reduce the voltage offset of power supply buses under to minimize load curtailment of the power distribution system.

How can flexible shared energy storage improve the energy consumption capacity?

After connecting the buses 1-4 to the flexible shared energy storage equipment, the source load matching optimization of the four lines corresponding to the buses can be coordinated through the flexible shared energy storage, which can significantly improve the consumption capacity for the newly generated energy.
