

How to consider the capacity rental of energy storage power stations

What is energy storage capacity?

The quantity of electrical energy stored in an energy storage facility plays a critical role in sustaining the operation and functionality of energy storage systems. The power capacity of a facility can be determined by considering its output/input power, conversion efficiency, and self-discharge rate.

Can energy storage power station operate continuously?

However, due to constraints such as power limits, capacity limits, and self-discharge rates, the energy storage power station cannot operate continuously but rather engages in charging and discharging activities at optimal times.

How efficient are energy storage stations?

The charging and discharging efficiency of the energy storage station is 95 %, with a conversion efficiency of 90.25 % for each charging and discharging cycle, resulting in a loss of 9.75 % per cycle. In real-time electricity pricing, there is a significant price difference between peak and off-peak periods.

What is the optimal configuration for energy storage?

The optimal configuration for power and maximum continuous energy storage duration is determined to be 30.99 MW and 4.52 h, respectively. At this configuration, the average daily return is 2.362 × 10⁵ yuan and the initial investment cost is 1.45 × 10⁹ yuan. Fig. 20. Optimal solution selected by TOPSIS. Table 4. Optimal solution data.

What is the optimal capacity configuration and maximum continuous energy storage duration?

The optimal capacity configuration and maximum continuous energy storage duration are determined through computational analysis, yielding values of 30.8 MW and 4.521 h, respectively. At this configuration, the daily average revenue is 2.362 × 10⁵ yuan, the initial investment cost is 1.45 × 10⁹ yuan, and the payback period is 4.562 years. 1.

What is the rated power of a storage power plant?

All the data used were collected on-site at the power plant. The BESS has a rated power of 20 MW and a rated capacity of 40 MWh. It is assumed that the initial state of charge (SOC) of the storage power plant is 0.4, with upper and lower operating SOC limits of 0.95 and 0.05, respectively.
