

How do airguns work?

Airguns operate by utilizing high-pressure air to propel a projectile down the barrel. PCP airguns, for instance, store high-pressure air in a cylinder for each shot. Multi-pump airguns require their cylinders to be refilled between each shot using an integrated pump, while CO2 airguns rely on compressed CO2 cylinders.

How do you store an airgun?

With care and effort, properly stored airguns retain pinpoint accuracy for a lifetime. Responsibly storing airguns delivers years of consistent shooting enjoyment and retains investment value. Prioritise locking cases for safety and weather protection. Dehumidify storage spaces, clean/lube metal, and isolate pellets in firm containers.

How do I Keep my airgun safe?

By understanding key airgun storage considerations and following best practices on security, weatherproofing, maintenance and organisation, you can keep your air rifle shooting like new for years of lasting enjoyment. The first rule of airgun storage is to keep your gun properly secured against unauthorised handling when unattended.

How do you store airgun pellets?

Take care to properly store ammunition, like airgun pellets, to prevent deformation over time. Avoid cardboard pellet boxes, which easily damage the projectile shape through pressure and movement. Instead, use firm plastic tins with secure lids to protect the shape. Inspect pellets visually prior to loading after prolonged storage.

How does a gas ram work?

While a gas ram doesn't look like a traditional metal coil spring, it is a "mechanical device that stores energy when compressed and returns to shape once released." Airguns operate by utilizing high-pressure air to propel a projectile down the barrel. PCP airguns, for instance, store high-pressure air in a cylinder for each shot.

What is a gas ram airgun?

To keep things easy, we will refer to all airguns operated by a metal spring or a gas ram as spring airguns. While a gas ram doesn't look like a traditional metal coil spring, it is a "mechanical device that stores energy when compressed and returns to shape once released."

If storing your pcp rifle for a short while is it best to remove the bottle or to run the cylinder empty? Or does it make absolutely no difference what so ever?
