How can capacity tariffs improve energy storage systems?

Several studies have shown that a well-designed capacity tariff mechanism can effectively incentivize the development and optimized operation of energy storage stations, thereby enhancing the flexibility and reliability of the power system (Huang et al., 2023; Khalilpour and Lusi, 2020; Varghese and Sioshansi, 2020; Zhang et al., 2023).

How do energy storage operators make decisions?

Energy storage operators act as followers, making decisions regarding storage capacity and operational strategies based on the tariffs set by the grid. Their decision-making process incorporates historical capacity tariffs, operating costs, expected returns, and market dynamics.

How does a capacity tariff work for grid-side energy storage stations?

However, according to the current policy of regulatory pricing, particularly the "Opinions on Further Improving the Price Formation Mechanism for Pumped Storage Energy" , the capacity tariff for grid-side energy storage stations essentially functions as an equal annual payment mechanism for initial investment recovery.

How does energy storage affect power system operation?

Incorporating the energy storage system has demonstrated significant impacts on power system operation, effectively regulating the power supply-demand balance while enhancing both system stability and operational efficiency. Fig. 8. Comparison of the net load curve.

Does China need a capacity tariff mechanism for grid-side energy storage?

Therefore, it is necessary to use the capacity tariff mechanism to ensure that the basic income of the energy storage power station is conducive to the operation and survival of the development of energy storage in China at this stage. The Chinese government has proposed implementing a capacity tariff for grid-side energy storage.

How does energy storage make money?

In mature power markets, energy storage derives its revenue primarily from participating in energy and ancillary service markets, such as those for peak shaving and frequency regulation (John et al., 2022; Wu et al., 2021). Market-based pricing mechanisms dominate energy storage valuation.
