

It is difficult to implement profit sharing for energy storage equipment

Does shared energy storage sharing provide a fair distribution of benefits?

To ensure a fair distribution of cooperative benefits, we introduce a benefit allocation mechanism based on contributions to energy storage sharing. Utilizing realistic data from three buildings, our simulations demonstrate that the shared storage mechanism creates a win-win situation for all participants.

How a shared energy storage system works?

A two-stage model describing the storage sharing among stakeholders is developed. Storage sharing contribution rate is defined to inspire stakeholders to join share. An incentive mechanism is designed based on the asymmetric Nash bargaining model. Shared energy storage system ensures the economic feasibility of all participants.

How do we integrate storage sharing into the design phase of energy systems?

We adopt a cooperative game approach to incorporate storage sharing into the design phase of energy systems. To ensure a fair distribution of cooperative benefits, we introduce a benefit allocation mechanism based on contributions to energy storage sharing.

Does a shared storage system have a complementarity of power generation and consumption?

In this context, considering the complementarity of power generation and consumption behavior among different prosumers, this paper proposes an energy storage sharing framework towards a community, to analyze the investment behavior for shared storage system at the design phase and energy interaction among participants at the operation phase.

What is shared Energy Storage (SES)?

As a new paradigm of energy storage industry under the sharing economy, shared energy storage (SES) can effectively improve the comprehensive regulation ability and safety of the new energy power system.

Are shared energy storage rates correlated with shared charging/discharging power?

In the shared energy storage mechanism proposed in this paper, the contribution rates of all prosumers are positively correlated with their shared charging/discharging power, that is, the greater the shared charging/discharging power, the more the cost-saving of prosumers.

Due to the cost inefficiency of the individual framework and the difficulty of applying this framework to the grid-scale ES, many studies have suggested the sharing ...

After determining the storage sharing mode, how to find a suitable profit allocation mechanism is the key and difficult point of designing a storage sharing optimization framework.
