What is compressed air energy storage?

Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distribution centers. In response to demand, the stored energy can be discharged by expanding the stored air with a turboexpander generator.

What are the main components of a compressed air system?

The largest component in such systems is the storage medium for the compressed air. This means that higher pressure storage enables reduced volume and higher energy density.

Why should energy storage systems be incorporated into energy systems?

The intermittency nature of renewables adds several uncertainties to energy systems and consequently causes supply and demand mismatch. Therefore, incorporating the energy storage system (ESS) into the energy systems could be a great strategy to manage these issues and provide the energy systems with technical, economic, and environmental benefits.

Does Kansas have a compressed air energy storage Act?

For example, the state of Kansas has facilitated these processes with their Compressed Air Energy Storage Act, effective since 2009. A study that reports on promising locations, permitting processes and challenges, and mitigating solutions would help developers navigate these issues during the planning phase.

When was compressed air first used?

Starting in 1896, Paris used compressed air to power homes and industry. Beginning in 1978 with the first utility-scale diabatic CAES project in Huntorf, Germany, CAES has been the subject of ongoing exploration and development for grid applications. The U.S. Department of Energy (DOE) has a history of supporting CAES development.

How are energy storage systems classified?

The most common methods for classification of ESSs are based on energy usage in a specific form, including electrical energy storage (EES) and thermal energy storage (TES), or based on the types of energy stored in the system (kinetic or potential; thermal, electrical, mechanical, chemical, etc.) [11,18,23].
