

Can thermal energy storage and battery energy storage systems be integrated?

This paper explores the integration of thermal energy storage (TES) and battery energy storage systems (BESS) within EHs, utilizing Digital Twin (DT) technology for energy management. DTs provide real-time monitoring, simulation, and optimization, facilitating the efficient use of RES and improving system reliability.

Does Integrated Electrical and thermal energy storage reduce the total electricity cost?

The proposed optimization algorithm is embedded into the control strategies of the DT platform, aiming to validate the effectiveness of the integrated electrical and thermal energy storage system in reducing the total electricity cost of the LEC. Figure 5 presents the overview of the LEC demand and generation without the integrated storage system.

Can thermal energy storage and battery energy storage improve local energy communities?

This research demonstrates that integrating thermal energy storage (TES) and battery energy storage systems (BESS) within energy hubs (EHs), supported by Digital Twin technology, significantly enhances grid stability, operational efficiency, and cost-effectiveness in local energy communities (LECs).

What is thermal energy storage (TES)?

For example, thermal energy storage (TES) systems can utilize excess electrical energy to heat water or other mediums during times of low electricity demand, thus storing energy in a form that is both usable and efficient. Research on EH and LEC has revealed various integration strategies, each with distinct benefits and challenges.

What are energy storage and management technologies?

Energy storage and management technologies are key in the deployment and operation of electric vehicles (EVs). To keep up with continuous innovations in energy storage technologies, it is necessary to develop corresponding management strategies. In this Review, we discuss technological advances in energy storage management.

Can a battery thermal management system save energy?

Finally, the ANSYS simulation results show that the proposed battery thermal management system can save 76.4% of energy compared to the conventional cooling system, while maintaining the average temperature of cells around the optimal operating temperature. And the temperature non-uniformity is reduced from 1.5 °C to around 0.6 °C.
