

Mileage cost of energy storage frequency regulation

Are regulation capacity and regulation mileage related in the market clearing process?

In this paper, to accurately present the relationship between regulation capacity and regulation mileage in the market clearing process, a performance-based regulation market model is first developed and their relationships are analysed based on the market simulation results.

Is energy storage a new regulatory resource?

As a new type of flexible regulatory resource with a bidirectional regulation function [3,4], energy storage (ES) has attracted more attention in participation in automatic generation control (AGC). It also has become essential to the future frequency regulation auxiliary service market.

Is there a market model for energy and performance-based frequency regulation services?

Comparison of frequency deviations under traditional market model and performance-based market model
This paper presents the mathematical formulation of a market model for energy and performance-based frequency regulation services. The charging and discharging schedules for fast-ramping energy storage units are taken into considerations.

Do market clearing prices correlate with regulation mileage?

The analysis of the components of market clearing prices accurately indicates the correlation between regulation capacity and regulation mileage. To accommodate the proposed regulation market design, AGC allocation algorithm is adjusted based on the market clearing results.

What is frequency regulation power optimization?

The frequency regulation power optimization framework for multiple resources is proposed. The cost, revenue, and performance indicators of hybrid energy storage during the regulation process are analyzed. The comprehensive efficiency evaluation system of energy storage by evaluating and weighing methods is established.

What is a system average mileage multiplier?

The system average mileage multipliers, indicating the ratio between the total regulation mileage provided and the total regulation capacity procured, are obtained from the historical regulation performance of the system [13, 14].
