How much does nmc111 battery cost?

NMC111 with equal shares of nickel, manganese and cobalt assumed here. Battery pack price of 130 USD/kWh assumed. Values in brackets show baseline raw material cost assumptions based on monthly average prices from 2010-2020.

What is the difference between LFP and NMC battery pack prices?

LFP battery pack prices are most sensitive to copper, aluminium and lithium hydroxide cost. A quadrupling of all three would increase pack prices by ~35%. In contrast, NMC battery pack prices are most sensitive to the cathode materials, nickel and cobalt. A quadrupling of the cost for both would increase NMC battery pack prices by more than 50%.

What type of battery is an NMC battery?

An NMC battery, which stands for nickel metal hydride, is a type of rechargeable battery that contains a hydrogen-absorbing alloy as the negative electrode and nickel oxide as the positive electrode. The electrolyte is usually an aqueous solution of potassium hydroxide.

Is NMC more expensive than LFP?

Taking average raw material cost, NMC is 66% more expensive than LFP. Mechanical storage technologies have the lowest material cost below 20 USD/kWh due to the low-cost materials employed. Figure 1 - Raw material cost for common electricity storage technologies.

Does raw material cost affect lithium-ion battery pack prices?

The analysis shows that each material only contributes a minor share to total raw material cost. In addition, total raw materials cost only constitute a share of total product price. The cost increase of one raw material will therefore only have a limited impact on lithium-ion battery pack prices.

What is the Fastmarkets battery Cost Index?

The Fastmarkets Battery Cost Index is an easy-to-use cost model for total cell costs, including cost breakdown of active anode material (AAM), cathode active material (CAM), separator, electrolyte, other materials, energy, labor and operational costs across multiple chemistries and geographies.
