

How does a 7750 start-stop-reset work?

The start-stop-reset functions of the chronograph are controlled by a layered switching cam, which is manufactured through a simple stamping process, similar to many other parts of the 7750 movement. This cam is responsible for making and breaking the connection between the movement and the chronograph.

When did the 7750 come out?

It was officially introduced to the watch world around 1973/1974 but after the first run was manufactured, the caliber wasn't produced again until 1985 (thanks to mechanical timepieces gaining popularity once again). The 7750 was partially designed on a computer - a first for the watch industry.

How many jewels does a 7750 have?

The 7750 is a self-winding chronograph movement with 25 jewels, ball-bearing rotor, unidirectional winding, 1/8-seconds counter, 30-minute counter, 12-hour counter, 28,800 A/h, power reserve ca. 44 hours. The key distinguishing features of the 7750 family are as follows:

What makes a 7750 a good watch?

Last but not least, the distinguishing feature which conveyed the immediately recognizable look to many of the 7750-powered watches was its design, which provided for the subdials at 6, 9 and 12 o'clock, for the chronograph 12-hour counter, running seconds, and the chronograph 30-minute counter, respectively.

What is Valjoux ETA 7750?

Since the takeover of Valjoux by ETA the movement is also called ETA 7750. This calibre is still produced and is probably the most successful automatic chronograph movement of all times. It serves as basis for several superstructures or modules, including many from other manufacturers.

How many jewels does a ETA 7750 have?

The initial 7750 movement used 17 jewels, but current versions of the 7750 have 24 or 25. It has been supplied at both 21,600 or 28,800 beats per hour, though the latter is much more common. ETA produces 7750 movements in three finishes:

These are the most popular ETA movements and oftentimes questions arise to the movements' general qualities and composition as a comparison. So, I hope this chart helps ...

While renewables generated 38% of global electricity in 2024, the International Energy Agency reports 12% of wind/solar power gets wasted annually due to inadequate storage.

The Valjoux is seemingly everywhere. It seems like nearly every single Automatic Chronograph watch out there not using an in-house movement has a Valjoux 7750 ...

“In each gravity-based energy storage, a certain mass is moved from a lower point to an upper point - with the use of a pump, if water for example - which represents “charging” the storage, ...

That movement is the ETA 7750 or, as it was formerly and still commonly known, the Valjoux 7750. It is a movement that inspires heated debate among watch connoisseurs, ...

As Martin Green became ever more impressed by the performance of the Valjoux 7750 chronograph movement, he also found himself ever-enamored by its little quirks ...

The same is true for the caliber “7750”. The four-digit code stands for the chronograph caliber with coulisse-lever escapement from Valjoux (named after its origin, the Vallée de Joux). With ...

FAQS about What are the power plants that use solar energy storage What are the different types of energy storage? The most common types of energy storage coupled with solar power plants ...

First and foremost, gone is the traditional 7750 dial layout with 12-6-9 registers. Many brands are more inclined toward the ETA 7753 classic 3-6-9 configuration or in this instance, a balanced ...

Gerber used the 7750 as a base caliber, then added a second spring barrel to power the alarm, which was also wound by the movement’s rotor, which was slightly enlarged and made heavier ...

I first discovered the world of column wheel 7750 variants while looking at a Longines Heritage Chronograph. The movement looked vaguely familiar to me, yet I couldn’t ...
