

Principle of heat dissipation of outdoor energy storage battery

What is a thermal-based strategy for battery thermal safety?

Once thermal runaway and fire incidents occur, enhancing heat dissipation capacity and fire suppression capability represents the effective thermal-based strategy to mitigate thermal runaway propagation and contain fire hazards, ultimately ensuring battery thermal safety.

How does thermal runaway propagation occur between batteries?

The thermal runaway propagation between batteries occurs through heat conduction, heat convection and heat radiation (Fig. 2c). Heat conduction primarily occurs through surface contact between adjacent batteries 25.

How can a cooling spray improve the thermal safety of batteries?

In addition to thermal management strategies, improving the thermal stability and flame retardancy of internal battery materials is a critical approach to enhancing the thermal safety of batteries. In terms of fire prevention, cooling sprays have proven to be effective.

How does thermal management affect battery performance?

Meanwhile, thermal management serves as an external approach to protect batteries against extreme temperatures, with its efficacy directly determining battery lifespan, performance and safety. Ultimately, if batteries still undergo unpredictable thermal runaway, fire suppression strategies become the final safeguard.

What happens if a battery gets thermal runaway?

When a battery experiences uncontrollable heat release owing to the rapid conversion of electrical energy into thermal energy, it enters a state of thermal runaway 7. Thermal runaway can cause a fire and, in turn, thermal runaway propagation 8. Mitigating the occurrence of thermal runaway is crucial to ensure battery thermal safety.

How does heat conduction occur in a battery?

Heat conduction primarily occurs through surface contact between adjacent batteries 25. Heat convection arises from density gradients in air surrounding the battery owing to localized high temperature, with additional convective flow generated by vented gases during thermal runaway 26.
