

Reactive voltage compensation for independent energy storage power station

What is reactive power compensation technology based on energy storage?

The research focuses on energy storage reactive power compensation technology will be the coordinated control strategy between energy storage and other reactive power sources and the solution and optimization of joint programming problems. Hui YE, Aikui LI, Zhong ZHANG. Overview of reactive power compensation technology based on energy storage [J].

What is early storage reactive compensation?

The early storage reactive compensation mainly adopts short-time scale energy storage technology, such as superconducting energy storage, super-capacitor energy storage, and flywheel energy storage.

How to compensate reactive power in electric distribution network?

Hence these FACTS devices like STATCOM, SVC, SSSC etc. have been used to compensate reactive power in electric distribution network. Basically, these devices have been used for the study of stability analysis for voltage and angle. With the proper management of reactive power, this has become an important aspect of distribution power network.

What is a real-time balance of reactive power based on reactive power compensation?

The real-time balance of reactive power based on reactive power compensation is critical to power systems' safe and stable operation. The energy storage converter has a four-quadrant operation function that allows it to output or absorb reactive and active power simultaneously. It has the function of frequency and voltage regulation.

Can BESS compensate active and reactive power on EV fast charge?

As seen before, the BESS can compensate the active and reactive power on the EV fast charge. A high active power threshold has been chosen in this experimentation to avoid active power compensation. So the energy consumption to cover the reactive power compensation service has been analyzed.

What is active power compensation?

Active power compensation. The maximum active power provided by the BESS is 20 kW. So, a quantity of reactive power is available to be used. Indeed the control system can use that reactive power and the result is shown in Fig. 17. Fig. 17 shows as the reactive power requested by the EV fast charge can be provided by the BESS.
