Why do battery energy storage systems need grounding and bonding?

For grid-scale battery energy storage systems (BESS), grounding and bonding is essential for safety and performance. The goal of grounding and bonding is to achieve customer-targeted resistance levels. These low resistance levels allow fault currents to easily discharge into the ground, protecting people, equipment and the BESS itself.

How much ground resistance does a substation need?

Typically, the subterranean grid system of a substation will give the needed resistance. 5 Ω is frequently the acceptable value in light industrial or telecommunication central offices. For lightning protection, the arrestors must be paired with a maximum ground resistance of 1 Ω .

How does the size of a grounding system affect electrical resistance?

Its size influences both mechanical strength and electrical resistance. Fault Current (I_{fault}): The maximum prospective short circuit current that could flow in a fault, measured in amperes (A). Ground Grid Resistance (R_g): The effective resistance of the grounding system, which is a function of both the soil resistivity and the grid geometry.

What is a good grounding size for a high voltage substation?

For a high voltage substation upgrade, assume soil resistivity of 80 $\Omega\cdot\text{m}$, a larger grid of 30 m \times 30 m, conductor diameter of 0.03 m, and fault current of 2000 A. This case study illustrates how modifications in grid dimensions and material properties impact the grounding design.

What is a safe grounding grid in a high voltage substation?

IEEE Standard 80 provides guidelines for calculating safe grounding grid parameters in high voltage substations. It ensures personnel protection by controlling touch and step voltages, while also minimizing fault current impedances.

What is a good resistance level for a ground?

The NFPA and IEEE recommend a ground resistance value of 5 ohms or less while the NEC has stated to "Make sure that system impedance to ground is less than 5 ohms specified in NEC 50.56. In facilities with sensitive equipment it should be 5 ohms or less". "What is the acceptable resistance level for a ground?"
