

Temperature control system of energy storage power station

How much energy does a container storage temperature control system use?

The average daily energy consumption of the conventional air conditioning is 20.8 % in battery charging and discharging mode and 58.4 % in standby mode. The proposed container energy storage temperature control system has an average daily energy consumption of 30.1 % in battery charging and discharging mode and 39.8 % in standby mode. Fig. 10.

How much energy does a temperature control system use?

The average energy consumption of the proposed temperature control system accounts for about 3.5 % of the energy storage, in which the average energy consumption of charging mode and discharge mode accounts for 1.06 %, and the energy consumption of standby mode accounts for 1.41 %. Fig. 7.

How effective are control strategies for energy storage stations?

Six different control strategies are simulated and analyzed to quantify the system's comprehensive lifecycle benefits. The results demonstrate that the optimized control strategy enhances the overall energy storage station revenue by 2.63%, yielding an additional cumulative profit of CNY 13.676 million over the entire lifecycle.

What is the COP of a container energy storage temperature control system?

It is found that the COP of the proposed temperature control system reaches 3.3. With the decrease of outdoor temperature, the COP of the proposed container energy storage temperature control system gradually increases, and the COP difference with conventional air conditioning gradually increases.

What is the operation mode of energy storage battery?

When the energy storage battery operates in charging/discharging mode, the operation mode is VCRM for the proposed temperature control system when the outdoor temperature is greater than 20 °C. And the operation mode is switched to VPHPM when the outdoor temperature is greater than or equal to 20 °C.

What are the temperature control requirements for container energy storage batteries?

In view of the temperature control requirements for charging/discharging of container energy storage batteries, the outdoor temperature of 45 °C and the water inlet temperature of 18 °C were selected as the rated/standard operating condition points.
