What is thermal energy storage (TES) with phase change materials (PCM)?

Thermal energy storage (TES) with phase change materials (PCM) was applied as a useful engineering solution to reduce the gap between energy supply and energy demand in cooling or heating applications by storing extra energy generated during peak collection hours and dispatching it during off-peak hours.

What is phase change thermal energy storage?

Phase change thermal energy storage technology utilizes phase change materials (PCMs) to store energy by absorbing or releasing a large amount of latent heat during the phase transition process. As shown in Fig. 4, the phase change process typically includes solid-solid phase change, solid-liquid phase change, and gas-liquid phase change.

What is multi-stage phase change heat transfer technology?

Multi-stage phase change heat transfer technology involves organizing PCMs with different phase change temperatures in a specific sequence to form a multi-stage phase change thermal storage system.

What are thermal energy storage technologies?

Thermal energy storage technologies utilizing phase change materials (PCMs) that melt in the intermediate temperature range, between 100 and 220 °C, have the potential to mitigate the intermittency issues of wind and solar energy. This technology can take thermal or electrical energy from renewable sources and store it in the form of heat.

How can a latent heat storage system improve heat transfer efficiency?

According to Eq. (1), the storage capacity of a latent heat storage system is closely related to the thermal properties of the phase change material (PCM). This indicates that enhancing the system's heat transfer efficiency should start from improving the thermal properties of the PCM.
